NOCK LIQUIDITY & PORTFOLIO STRATEGY

Multi-Tiered Asset Framework & Automated Capital Routing Blueprint on Base Network

1. PORTFOLIO ALLOCATION BREAKDOWN

Your total allocation of 100,000 Nock is structurally segregated into three independent operational layers designed to maximize upside capture, capture localized trading fee volume, and maintain a sovereign risk-free treasury reserve.

Strategic Layer	Nock Balance	USDC Pair	Operational Parameters / Boundaries
Tranche 1: Aggressive Uniswap V4 Runway	4,055.95 Nock	23.63 USDC	3% Fee Tier. Dynamic range scaling out from $0.01237 up to a hard ceiling of $2.02783.
Tranche 2: Volatile Passive Engine (Aerodrome)	6,328.59 Nock	139.97 USDC	0.3% Fee Tier. Basic Volatile configuration covering the full continuous spectrum (0 to ∞).
Tranche 3: Sovereign Protected Treasury	95,995.69 Nock	0.00 USDC	Liquid wallet reserve completely insulated from Impermanent Loss. Dormant until price cross > $2.00.

2. CAPITAL FLOW & AUTOMATED EXECUTION BLUEPRINT

Below is the logical execution grid detailing how cash flows from the underlying AMMs into your strategic reserves:

Source Protocol	Market Event / Trigger	Automated & Manual Action Items
Uniswap V4 Engine	Price appreciation ticks upward into the dynamic V4 distribution range.	• Liquidity automatically scales out of Nock into earned USDC. • Extract trading fees immediately; do not re-add to pool principal.
Aerodrome Slipstream	Local volume spikes trigger high organic trading swings inside the full-range pool.	• Harvest accumulated trading fees and AERO emissions routinely. • Funnel yield directly into your sovereign stable capital asset reserves.

Market Retraction	Token values experience a clean downward breach or localized flash crash.	• Deploy a calculated fraction of saved USDC from the vault. • Re-inject capital back into Aerodrome to organically lower cost basis.

3. RISK MITIGATION & CAPITAL GAINS MAINTENANCE

To ensure that scaling profits do not result in a severe out-of-pocket tax burden at fiscal year-end, all extractions must follow a rigorous **60/40 Split Rule** upon harvesting.

Allocation Split	Target Destination	Strategic Objective
40% Secure Escrow	Segregated Vault / Cold Wallet Reserve	Maintained completely isolated to buffer against future capital gains and income tax liabilities accrued during pool conversions.
60% Growth Capital	Liquid Dry-Powder Stable Account	Deployed as operational dry-powder to buy deep market retractions or selectively diversify into safe native ecosystem base layers.

4. CRITICAL MILESTONE MILEPOSTS

1. Protect Core Treasury: Under no circumstances should the 95,995.69 Nock sitting in reserve be committed to continuous AMM pools at baseline price ranges. This is your pure exposure asset.

2. The $2.02 Transition: If market velocity empties the Uniswap V4 pool of Nock, your position is 100% USDC. At that flashpoint, the range has fully executed its goal. Take the full principal and build single-sided high walls further up (e.g., $5.00+).

Notice: This layout reflects an operational blueprint based on user-specified liquidity parameters. Asset allocation and smart contract deployments carry inherent technical risks including impermanent loss and execution vulnerabilities.
